

Screen Your Dog for Over 150 Genetic Diseases and Traits!

Canine HealthCheck

The Canine HealthCheck is an at-home, canine genetic health test that allows dog owners to screen their dogs for over 150 genetic diseases and traits.

Dog owners swab the inside of their dog's cheek. They then return the sample to our laboratory via prepaid envelope. Seven to ten days after receiving their sample, we provide a breakdown of their dog's genetic health in their secure online account.

What is Included?

The Canine HealthCheck includes two sterile swabs to collect cheek cells, an instructional guide on how to collect the best sample, and a biohazard bag and prepaid return envelope to ship the sample to our laboratory.

What You Will See

Tasha's genetic health profile:

- ✓ Tasha is **at-risk** for the following 1 disease:
 - Dilated cardiomyopathy

- ✓ Tasha is a **carrier** for the following 2 diseases:
 - Collie eye anomaly
 - Degenerative myelopathy

Why Canine HealthCheck?

The Canine HealthCheck will allow you to better understand your dog's genetic health. Information on any diseases we test for is available on our website. Anything learned from this test can be shared with the owner's veterinarian to provide optimal care for their dog. The overall cost per test is less than \$1 as compared to veterinary diagnostic workups which can start at more than \$100. Avoid costly veterinary workups, care for diseases that are treatable, and intervene early when your dog shows clinical signs.
